

CHEM 2061 – Fall 2007 – EXAM #3 Name K E Y

1. (4 pts) Which of the following reactions involve inversion of configuration?
- 2° alkyl halide* *R-2-bromohexane* $\xrightarrow[-OH]$ *strong nucleophile* *S-2-iodobutane* $\xrightarrow[-SCH_3]$ *good nucleophile* *2° alkyl halide*
- 2° alkyl halide* $\xrightarrow[SN2]$ *inversion of config.* *(SN2) - inversion of config.*
- CH₃CH₂-C(CH₃)₂CH₂Br* I R-3-bromo-3-methylhexane $\xrightarrow[-OCH_3]$ III *3° alkyl halide*
- CH₃CH₂-C(CH₃)₂CH₂Br* II R-2-bromohexane $\xrightarrow[CH_3OH]$ IV *weak nucleophile* $\xrightarrow[SN1]$
- No SN2* *3° alkyl halide* a) I, II b) III, IV c) II, III d) I, IV e) I, II, III

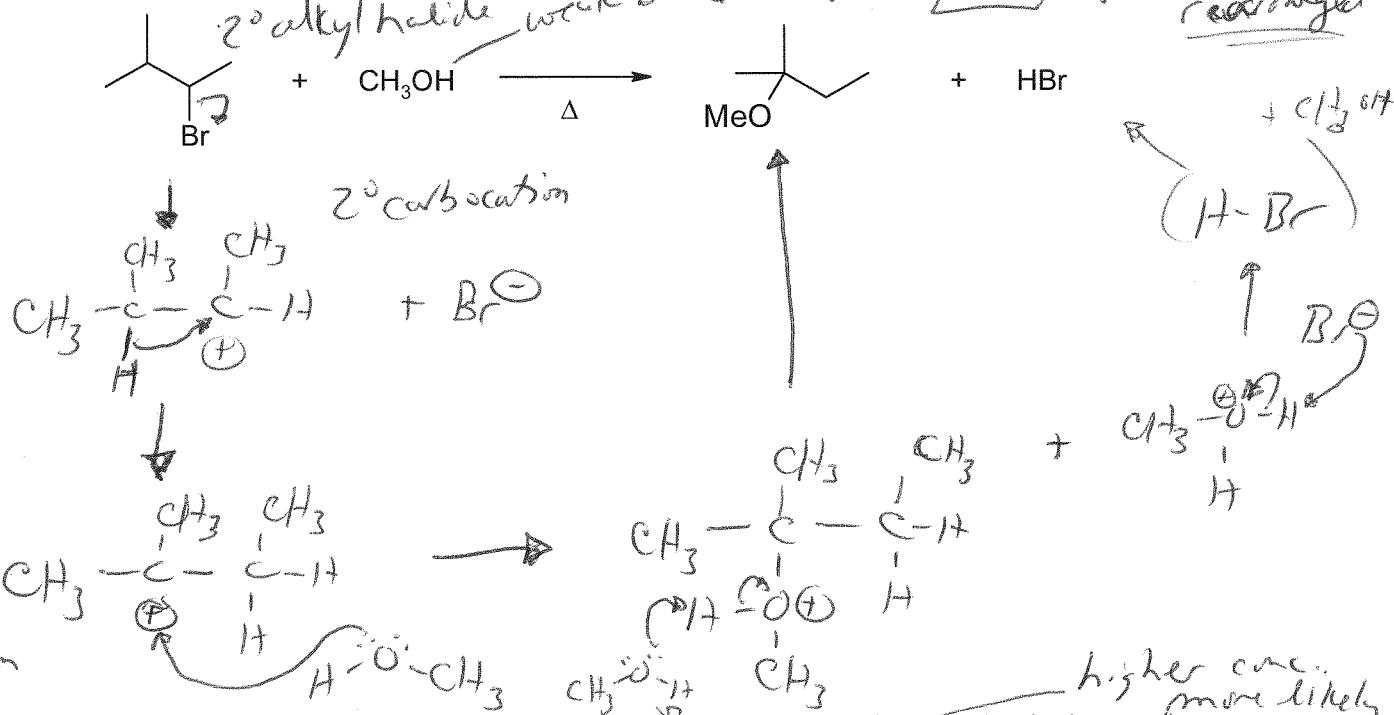

2. (10 pts, 5 each) A) Give the structure of the **major** organic product in each of the following substitution reactions, and B) predict whether the mechanism will be predominantly 1st order (S_N1) or second order (S_N2). Be sure to show the correct stereochemistry of the product when necessary. If the product is a racemic mixture, draw both enantiomers.

3. (10 pts, 5 each) A) Give the structure of the **major** organic product in each of the following elimination reactions, and B) predict whether the mechanism will be predominantly first order (E1) or second order (E2). BE SURE TO SHOW THE CORRECT STEREOCHEMISTRY OF THE PRODUCT WHEN NECESSARY.

4. (10 pts) Write the **complete mechanism** for the following substitution reaction that explains the formation of the products given.

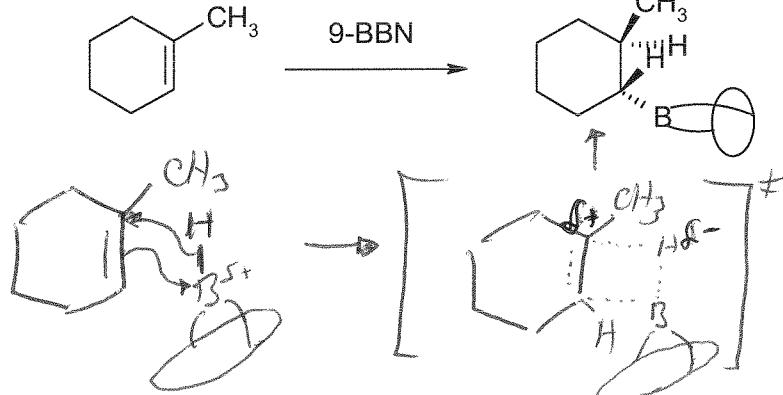

5. (8 pts) a) Explain WHY the syn addition product is the only product obtained when 1-methylcyclohexene undergoes hydroboration by 9-BBN. (Please show the mechanism of this hydroboration to aid in your explanation).

b) Please explain the regioselectivity of the 9-BBN addition.

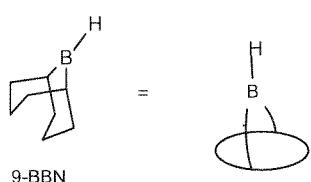

[Don't need to draw T.S. for full credit]

Need to show arrows drawn col (red way (S) here) for full credit

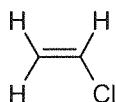

The addition rxn of H-B⁺ is a concerted rxn - S_n. The B + H add only to one face of the alkene to give the syn add product.

b) The boron of 9-BBN adds to the less-hindered side of the alkene (e.g. 1-BBu₃) because it is so bulky. Also, hydride adds to more substituted carbon because d⁺ on that carbon is most stable.

(3° more stable than 2°)

6. (2 pts) The IUPAC name of the following compound is 1-chloroethene.

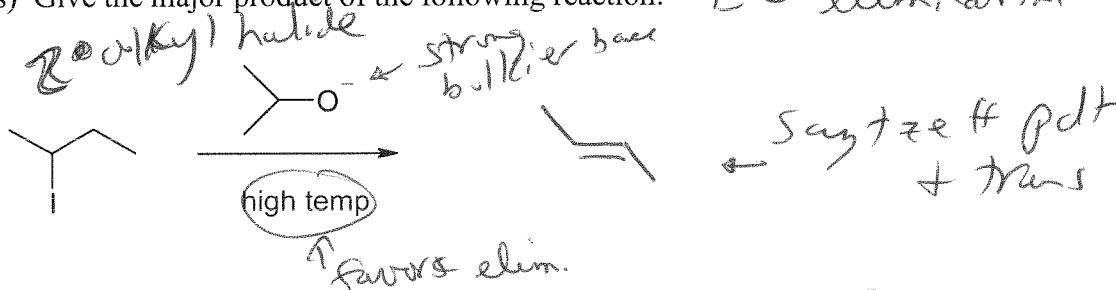

Another way to name this compound (the common name) is Vinyl chloride

7. (3 pts) Which of the following is the optimum set of conditions for an E1 reaction of t-butyl bromide?

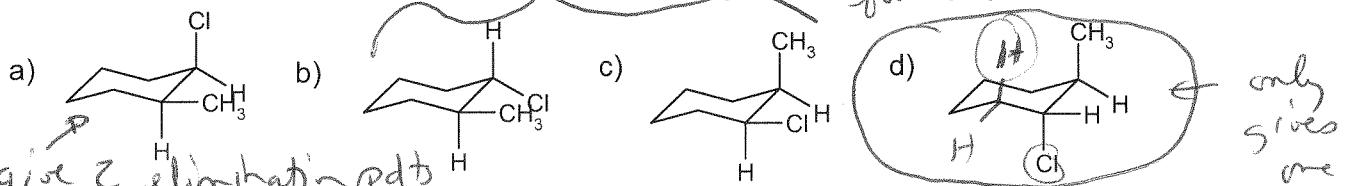

nucleophile/solvent	temperature (°C)	$\text{CH}_3-\overset{\text{C}}{\underset{\text{CH}_3}{\text{C}}} \text{Br}$
a) CH_3OH	25°C	
b) CH_3OH	80°C	→ higher temp favors elimination more than lower temp
c) CH_3O^- CH_3OH	25°C	
d) $\text{CH}_3\text{CH}_2\text{O}^-$ DMSO	25°C	
e) $\text{CH}_3\text{CH}_2\text{O}^-$ DMSO	80°C	

*b, d favor E1
but
all favor E2*

8. (4 pts) Give the major product of the following reaction:

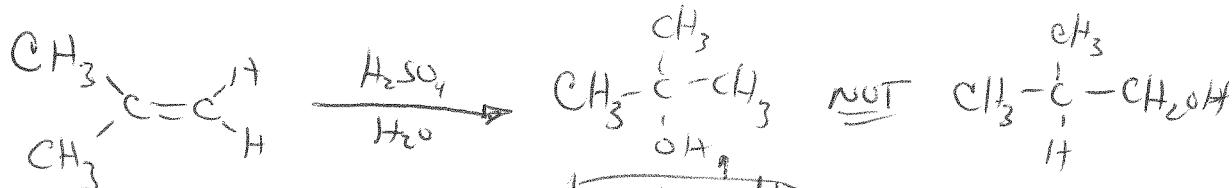

9. (3 pts) One of the isomers of 1-chloro-2-methylcyclohexane gives a single E2 elimination product upon reaction with potassium tert-butoxide. What is the reactive conformation of this isomer?

Can give 2 elimination pdts

10. (5 pts) Explain WHY, in the acid-catalyzed addition of water to 2-methyl-1-propene, the major product is 2-methyl-2-propanol and not 2-methyl-1-propanol.

When the alkene reacts with the electrophilic H^+ , the hydrogen attaches to the carbon with the most hydrogens because this gives the most stable carbocation intermediate (a 3° carbocation). This intermediate goes on to react w/ the H_2O nucleophile to form the alcohol.

11. (6 pts, 3 each) Which compound in each of the following pairs will react faster in an S_N2 reaction with OH? (Circle answer) **Briefly** explain why you chose your answer.

Brief explanation

a) $\text{CH}_3\text{CH}_2\text{I}$ in ethanol or $\text{CH}_3\text{CH}_2\text{I}$ in dimethyl sulfoxide

• polar, aprotic DMSO better solvent for S_N2 rxn

b) $\text{H}_2\text{C}=\text{CHBr}$ or $\text{H}_2\text{C}=\text{CHCH}_2\text{Br}$
 Sp^2 hybridized

• can't do S_N2 on sp^2 hybridized carbons. S_N2 rxn on 1° alkyl halide.

12. (4 pts) The name (E)-1-isopropyl-1-butene is incorrect. Explain why it is incorrect and give the correct IUPAC name.

correct name

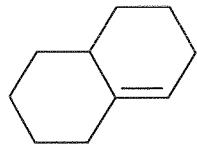

As written here this is the parent chain (boxed), but there is another longer chain containing the double bond

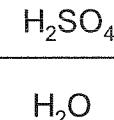

(E)-2-methyl-3-hexene

13. (28 pts, 4 each) Give the structure of the **major** organic product of each of the following reactions. **Clearly indicate stereochemistry where appropriate.** If the major product is a pair of enantiomers, only draw one of the two structures.

a)

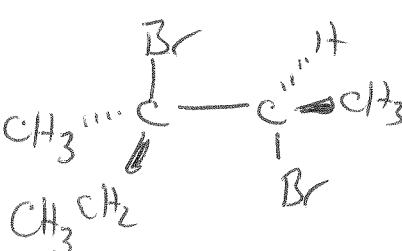

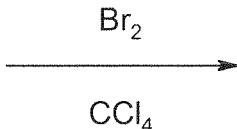

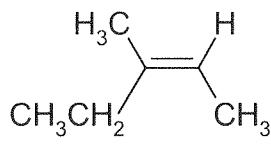

acid-catalyzed hydration

Markovnikov alcohol

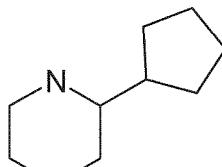

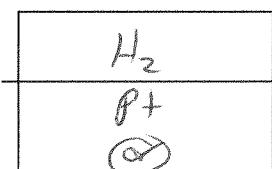

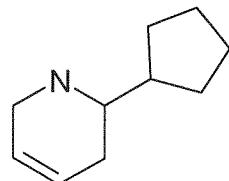

b)

Anti-Addn Pdt

+ enantiomer

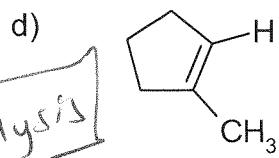

c)

Catalytic hydrogenation

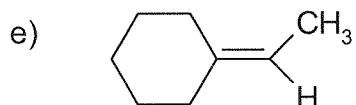

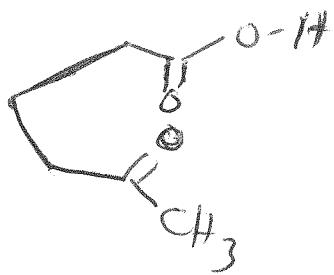

Hg Ni

Hg Pt/C

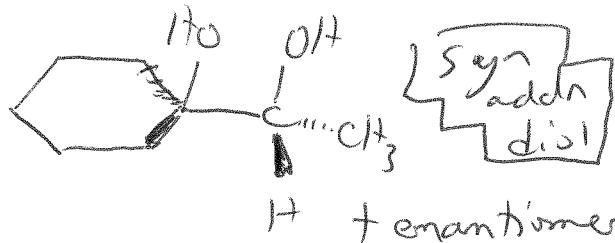

1) O_3
2) H_2O_2 , NaOH
3) H_3O^+

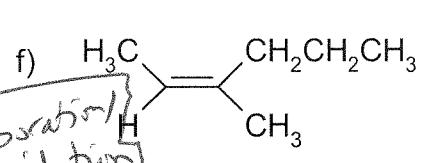

oxidative conditions

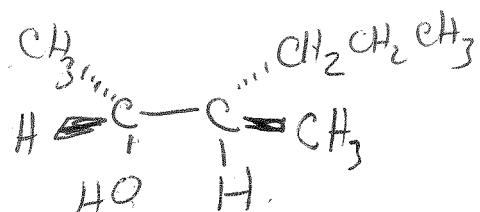

1) OsO_4
2) Na_2SO_3

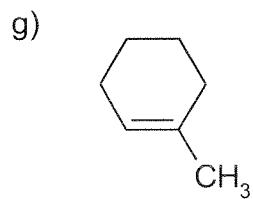

H^- + enantiomer

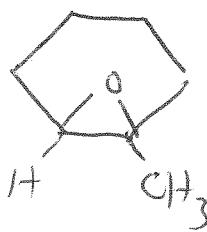

1) $BH_3\text{-THF}$
2) H_2O_2 , NaOH
 H_2O

syn addn - Anti-Mark.
alcohol

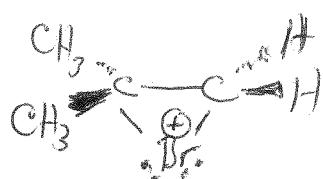

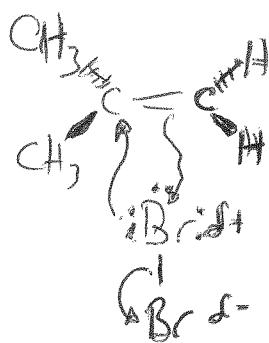

$m\text{-CPBA}$
 CCl_4

+ enantiomer

epoxidation

14. (3 pts) Draw the bromonium ion intermediate formed when Br_2 reacts with 2-methyl-1-propene.
